**DETAILED ACTION**

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 6-23-2003 has been entered.

Figures 8-11 should be designated by a legend such as --Prior Art-- because only that which is old is illustrated. See MPEP § 608.02(g). A proposed drawing correction or corrected drawings are required in reply to the Office action to avoid abandonment of the application. The objection to the drawings will not be held in abeyance.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-3, 5 and 7 are rejected under 35 U.S.C. 103(a) as being unpatentable over applicant's admitted prior art (Figs. 8-11) in view of DeCruz (6,422,139). Applicant's admitted prior art (Figs. 8-11) teaches the structure of an insertion platform 2 as claimed except that the admitted prior art does not teach the use of a light transmission member with a light source and the use of alignment marks. DeCruz teaches in a screen printing machine the conventionality of using a light box for accurately registering positives with screens. The light box has a light transmission member 2L operable to allow transmission of light from a lower side, a light source of 4 fluorescent lamps 34L mounted to a rigid frame 12L located below the light transmission

member 2L, and gridlines 13 serving as alignment marks with their respective reference numbers formed on the light transmission members 2L for aligning the positives. See Fig. 7A and column 10, line 49 through column 13, line 48 in DeCruz for example. In view of the teaching of DeCruz, it would have been obvious to one of ordinary skill in the art to provide the insertion platform of the admitted prior art with the light transmission member with a light source along with alignment marks appropriately disposed as taught by DeCruz in order to ensure and facilitate accurate registration of the superimposed sheets. With respect to claim 5, the recited external light lighting hole reads on the gridline holes 14 at the intersection of the gridlines 13 in DeCruz. Regarding claim 7, the recited heat roller pair are included in the prior art as shown in Figs. 8-11.

Claim 4 is rejected under 35 U.S.C. 103(a) as being unpatentable over applicant's admitted prior art in view of DeCruz, and further in view of JP 11-106685. The applicant's admitted prior art, as modified by DeCruz, does not teach the use of a fluorescent substance coated on the light transmission member. JP 11-106685 teaches applying a luminous coating material containing a fluorescent substance on a display so as to obtain the display having high afterglow luminance. It would have been obvious to those having ordinary skill in the art to provide the light transmission member of applicant's admitted prior art, as modified by DeCruz with a fluorescent substance coating in order to achieve a high afterglow luminance of the light transmission member to further facilitate the registration process.

Claims 6 and 8-11 are allowed.

The prior art of record does not teach the combination of structure of an insertion platform including particularly a cutout having a length in which the operator can continue to have the leading edge of both sheets in the superimposed condition until it is nipped.
